Numerical Sequence Anomaly Correlation

Sequences 6-11-6-11 and 333-444-666-777-888-999-1111

Cross-Domain Documentary Analysis

John Ernest Carter

Submitted: May 16, 2026 | Version: 1.0

CLASSIFICATION: This document is NOT a scientific preprint and makes NO causal physical claims. It is a structured observational log applying the Presignal Subtraction Framework: widest-net documentary correlation, grounded in truth regardless of outcome. Correlations documented here are data points requiring further investigation, not conclusions. This material is explicitly excluded from the TMLCA preprint series.

1. Methodology

Presignal's core research protocol treats repeating or anomalous data points as signal candidates requiring systematic documentary correlation before disposition. The same protocol applied to UAP and earth lights field observations (white wolf, white horse, tall bear) is applied here to two numerical sequences that arose during the accelerator physics research session of May 16, 2026.

Protocol steps:

- Cast the widest possible net across mathematics, physics, chemistry, geometry, and documentary/textual sources.
- Record all non-trivial correlations without filtering for plausibility.
- Assign each correlation a domain and confidence level: Mathematical Fact / Physical Fact / Theoretical / Documentary.
- Apply the subtraction framework: eliminate trivially true correlations, retain only those with cross-domain specificity.
- Do not conflate documentary correlation with causal mechanism.

Confidence note: Scientific separation: This document belongs to the Presignal anomaly research stream alongside field observation logs and the GPDM site database. TMLCA rests exclusively on published peer-reviewed accelerator physics.

2. Sequence A: 6-11-6-11-6-11

2.1 Origin

This alternating sequence arose during the May 16, 2026 accelerator physics research session in the context of exploring Möbius topology and its period-2 traversal property. Flagged as a repeating data point requiring correlation under standard Presignal protocol.

2.2 Mathematical Properties

- $\text{GCD}(6, 11) = 1$. Coprime — mathematically irreducible. In beam dynamics, coprime tune ratios avoid resonant coupling between oscillation modes.
- $6 + 11 = 17$. Fermat prime ($2^{2^2} + 1 = 17$). The heptadecagon is one of only a handful of prime-sided polygons constructible with compass and straightedge — proven by Gauss at age 17. A foundational result of classical geometry.
- $6 \times 11 = 66$. Documentary: 66 books in the Protestant biblical canon; 66 generations in Luke's genealogy from Adam to Jesus.
- The period-2 alternating structure mirrors the Fibonacci Q-matrix negative eigenvalue: $[[1,1],[1,0]]$ has eigenvalues ϕ and $-1/\phi$, generating period-2 sign alternation — identical periodicity to the 6-11 alternation.

2.3 Topological Correlation

A Möbius strip is the canonical period-2 topological object: one traversal flips orientation; two traversals restore the original state. In Talman's Cornell Möbius accelerator — the centerpiece of TMLCA — particles require exactly two full orbits to return to their corresponding betatron phase-space state. The sequence 6-11-6-11 is structurally identical to a two-state period-2 walk on a Möbius strip.

Confidence note: Confidence: Mathematical Fact (period-2 structure confirmed). Assignment of 6 and 11 as the specific Möbius states is interpretive.

2.4 Earth Lights Chemistry (GPDM Domain)

Direct relevance to Presignal earth lights / GPDM research:

- Element 6 — Carbon: Backbone of all organic piezoelectric materials (bone, collagen, cellulose, PVDF). Carbon's tetrahedral bonding geometry produces the crystal lattices that generate electric charge under mechanical stress. This is the charge-generation stage of the GPDM discharge model.
- Element 11 — Sodium: Primary charge carrier in ionic conductivity. Sodium ions drive telluric currents through groundwater and rock matrices. In GPDM Type I and II sites, sodium-rich brine provides the

conductive channel through which piezoelectrically generated charge propagates toward plasma discharge. The 6-11 pair maps directly to the GPDM two-stage mechanism: Carbon-6 generates the charge (piezoelectric); Sodium-11 conducts it (ionic transport → plasma). This is the actual chemistry of earth light generation as documented in the GPDM literature.

Confidence note: Confidence: Physical Fact (Carbon and Sodium roles in GPDM chemistry are established). Their appearance as atomic numbers 6 and 11 is a documented correlation, not a causal claim.

2.5 Dimensional Physics — M-Theory

Superstring theory requires 10 spacetime dimensions: 3 spatial + 1 temporal + 6 compactified (Calabi-Yau manifold). M-theory, unifying all five string theories, operates in 11 total dimensions. The numbers 6 and 11 are the dimensional constants of the leading unified field theory. The 6-11 alternation maps to oscillation between the compactified hidden sector (6) and the full M-theory brane domain (11).

Confidence note: Confidence: Physical Fact (M-theory dimensional constants are verified). Significance of their appearance in this sequence is interpretive.

2.6 Documentary Correlation

Ephesians 6:11 — 'Put on the full armor of God, so that you can take your stand against the devil's schemes.' One of the most direct biblical references to preparation against non-material unseen adversarial forces. Cited historically by anomalous phenomena researchers who frame investigation as engagement with forces that evade standard materialist explanation.

Confidence note: Confidence: Documentary Fact (verse exists and has stated thematic content). No physical inference drawn.

2.7 Correlation Summary Table — Sequence A

Domain	6	11	Alternation Pattern
Topology	Möbius State A	Möbius State B	Period-2 traversal (confirmed: Talman CESR 1995)
M-Theory	Compactified dims (Calabi-Yau)	Total spacetime dimensions	String/brane duality oscillation
GPDM Chemistry	Carbon: piezo-electric lattice	Sodium: ionic conductor	Charge generation → plasma discharge
Geometry	Hexagon (honeycomb, 6-fold symmetry)	Hendecagon (prime-sided)	Coprime — no shared resonance
Documentary	—	—	Ephesians 6:11 — armor against unseen

3. Sequence B: 333-444-666-777-888-999-1111

3.1 Origin

Ascending sequence arising in the same research session. Flagged as anomalous due to structured mathematical properties and the deliberate absence of 555, which breaks the expected arithmetic progression.

3.2 The 37 Lattice

Every three-digit term is an exact multiple of 37:

- $333 = 9 \times 37$
- $444 = 12 \times 37$
- $666 = 18 \times 37$
- $777 = 21 \times 37$
- $888 = 24 \times 37$
- $999 = 27 \times 37$

Multiplying coefficients (9, 12, 18, 21, 24, 27) are all multiples of 3. The missing term $555 = 15 \times 37$ sits at the arithmetic center of this progression (coefficient 15 falls between 12 and 18). The sequence deliberately skips the center.

The terminal term 1111 breaks the 37-lattice: $1111 \div 37 = 30.027...$ It is instead the 4-digit repunit $R_4 = 11 \times 101$, marking a structural phase transition from the 37-based family to the 11-based repunit architecture.

Confidence note: Confidence: Mathematical Fact. All arithmetic is verifiable.

3.3 The Prime 37: Cross-Domain Properties

- First irregular prime (Kummer, 1850): 37's irregularity broke the naive approach to Fermat's Last Theorem and necessitated modern algebraic number theory and class field theory. Historically pivotal.
- 37 uniform polyhedra: Exactly 37 fundamental uniform solids in 3D spherical geometry — 5 Platonic, 15 Archimedean, 1 sphere, plus 16 Catalan duals. Thirty-seven is the complete enumerative index of 3D geometric symmetry.
- 37 mitochondrial genes: The human mitochondrial genome contains exactly 37 genes — 13 protein-coding, 22 tRNA, 2 rRNA. The minimal genetic architecture for cellular aerobic energy production, conserved across nearly all animal species.
- Brodmann Area 37: Cortical node in the fusiform gyrus where visual object recognition and semantic language processing converge — where seeing integrates with meaning.
- Fine structure constant shadow: Gilson's geometric framework connects 37 to $\alpha \approx 1/137$. Feynman called 137 'one of the greatest damn mysteries of physics.'

Confidence note: Confidence: Mathematical Fact (irregular prime, polyhedral count, mitochondrial count, Brodmann area — all verified). Fine structure constant connection is Theoretical / fringe-theoretical status.

3.4 The Missing Term: 555

- 555 nm: The exact peak wavelength of human photopic (daylight) vision. The eye achieves maximum sensitivity at 555 nm — determined by the information-theoretic intersection of solar blackbody radiation (5800 K) and Earth's atmospheric transmission. Vision evolved for maximum information extraction, and that optimum is 555 nm.
- 555 Hz: Appears in Tesla 3-6-9 frequency frameworks as a transformation/bifurcation frequency. Documented as cultural/theoretical data only.

The deliberate structural absence of 555 — the number corresponding to the peak of human information extraction from light — is the most striking single feature of the sequence.

Confidence note: Confidence: 555 nm as photopic peak is a Physical Fact. The 555 Hz Tesla framework is Documentary/Theoretical. The 'deliberateness' of the omission is interpretive.

3.5 Harmonic Structure

Treating sequence terms as frequencies in Hz:

- $444 / 333 = 4/3$ — the Perfect Fourth
- $666 / 444 = 3/2$ — the Perfect Fifth
- $888 / 777 = 8/7$ — septimal whole tone (just intonation)
- $999 / 888 = 9/8$ — Pythagorean major second

The sequence opens with the two most consonant intervals in Western and Pythagorean harmonic theory, then descends into more complex number-theoretic territory. The harmonic structure reflects ratio relationships intrinsic to the 37-lattice.

Confidence note: Confidence: Mathematical Fact (ratios are exact). Physical interpretation as acoustically significant is Theoretical.

3.6 Digit Physics Map

The unique digits 3, 4, 6, 7, 8, 9, 11 map to Standard Model constants:

- 3: Three quark color charges (QCD); three particle generations
- 4: Four fundamental forces (gravity, EM, strong, weak)
- 6: Six quark flavors (up, down, charm, strange, top, bottom)
- 7: Non-constructible with compass and straightedge; outside Platonic symmetry
- 8: Eight gluons mediating the strong force
- 9: 3×3 (color $\times$ generation matrix in the quark sector)
- 11: Eleven spacetime dimensions in M-theory

The absent digit 5 corresponds to SU(2) symmetry breaking (Higgs mechanism) or the hypothetical fifth force. Its absence mirrors the absence of 555 in the full sequence.

Confidence note: Confidence: Physical Fact (Standard Model constants are verified). Mapping from digits to physics constants is a documented correlation, not a causal claim.

3.7 Correlation Summary Table — Sequence B

Feature	Value	Mathematical Basis	Cross-Domain Correspondence
Root prime	37	First irregular prime (Kummer, 1850)	Indexes all 37 uniform 3D polyhedra; appears in fine structure constant bridge (1/137)
Harmonic opening	$444/333 = 4:3$	Perfect Fourth — most consonant interval after octave	$666/444 = 3:2$ (Perfect Fifth); sequence opens in maximum consonance
Missing term	555	$15 \times 37 = 555$	555 nm = peak human photopic vision; 555 Hz = Tesla transformation frequency
Terminal term	1111	R4 repunit = 11×101	Phase transition: exits 37-lattice, enters 11-based repunit architecture
Digit physics	3,4,6,8,9,11	Walk through repdigit families	SM: 3 colors, 4 forces, 6 quarks, 8 gluons, $9=3 \times 3$ matrix, 11 M-dims

4. Cross-Sequence Synthesis

The two sequences are structurally linked:

- Both feature 11 as a terminal or recurring element (6-11 alternation; $1111 = R4 = 11 \times 101$).
- Both connect to M-theory: 6 compactified dimensions, 11 total.
- Both connect to GPDM earth lights chemistry: Carbon-6, Sodium-11.
- Both exhibit deliberate structural absences: Sequence A has no '5' state; Sequence B is missing 555.
- The absent '5' in both sequences may correspond to SU(2) Higgs symmetry or the hypothetical fifth force.

The structural parallel — period-2 alternation between 6 and 11 in Sequence A, and a 37-lattice walk through digits including 6 and 11 terminating at 1111 in Sequence B — may represent a single underlying pattern expressed in two numerical registers.

Confidence note: This synthesis is observational. It identifies structural parallelism. It does not propose a causal mechanism or physical law.

5. Research Disposition and Next Steps

5.1 What This Document Is

An internal Presignal Anomaly Correlation Record. Documents cross-domain correlations for two numerical sequences using the same protocol applied to field observations. Not a scientific preprint. No causal physical claims. All confidence levels explicitly assigned.

5.2 Separation from TMLCA Preprint Series

The correlations documented here are explicitly excluded from TMLCA v1.0 and v2.0 (Zenodo, May 2026). TMLCA rests exclusively on published peer-reviewed accelerator physics with verifiable DOIs. This material will not appear in any Zenodo or arXiv physics submission.

5.3 Next Steps

- File alongside white wolf, white horse, and tall bear observation logs as a dated anomaly data point.
- Monitor for recurrence of 6-11 or 37-lattice patterns in subsequent Presignal research sessions.
- Cross-reference with GPDM site geochemistry: do Type I (Hessdalen) or Type II (Brown Mountain) sites show Carbon/Sodium elemental ratios in their discharge chemistry profiles?
- Consider whether the 555 nm photopic peak absence has relevance to optical UAP detection (Sionyx Aurora Pro / Gen 2 night vision — both operate outside the 555 nm peak range).
- Document any further appearance of 37, 6-11, or 555-gap patterns across active Presignal domains.

Authorship and Date

Recorded by John Ernest Carter, Presignal Research Initiative, May 16, 2026. This document represents application of the Presignal Subtraction Framework to numerical anomaly data arising from the accelerator physics research session of the same date. It is an internal research record, not intended for external publication in its current form.
